

Else if Statements and .equals()

What are else if Statements?

We usually use an else if statement when there are more than 2 conditions. We usually use else ifs to specify a new condition to test, if the first condition is false.

What is the .equals() function?

The .equals() function is the equivalent of == except for String. The String class uses the .equals() function to return true if the String was equal to the parameter. It returns false if the String is not equal to the Parameter.
